Attached are a subset of the QA'd human studies. For those who have time to take a look, we can try to begin to discuss these tomorrow as well, assuming the animal study QA discussion goes quickly.

Barbara and John,

We have completed QA review of a subset of human study table entries for formaldehyde (entries in all of the sensory irritation tables and 4 of the 5 pulmonary function tables); the revised tables are attached for your review. The files correspond to separate tables of data. We will compile all of the QA'd tables together when we complete the rest of the review. As with the animal studies, there were several formatting issues or differences in how information was presented across tables/study rows. We will provide a list of the issues we note when the remainder of the human studies is completed.

Please let us know if the information we provide during the QA of these tables is meeting your needs, or if you would like us to refocus our efforts during review of the remaining tables.

Thank you-

Heather
